Example: 2,4,6,8,10,...is an arithmetic sequence with the common difference 2. If the first term of an arithmetic sequence is a1 and the common difference is d, then the n th term of the sequence is given by: a n = a 1 + (n - 1) d. An arithmetic series is the sum of an arithmetic sequence. We find the sum by adding the first, a 1 and last term, a n, divide by 2 in order to get the mean of the two values and then multiply by the number of values, n:

Sequence and Series-Definition, Types, Formulas and Examples
A recursive formula creates a sequence where each term is defined by the term(s) that precede it. In other words, in order to know term 12, you have to know term 11, etc. The problem already tells us that the first term is 2. Let's find the second term. We continue to find the rest of the terms in this way.

So when we add up a portion of the sequence we just get what is called a partial sum, okay? So we're just adding up sum of the terms in the sequence. And we actually have a formula for the sum of an arithmetic sequence. And how it works is s of n, so this is the sum of the first n terms in this series is equal to n over 2.
