Does the vaccine for measles, mumps, and rubella cause autism? What is the most common reason that DNA analyses overturn incorrect criminal convictions? What genetically modified foods do most people in the United States consume (usually without knowing it)? In his popular classes and bestselling textbooks, Jay Phelan uses questions like these as a way of introducing both the practical impact and awe-inspiring wonder of biological research. Phelan knows how to captivate nonmajors with stories of how scientists investigate life. He is also a master at using the study of biology as a context for developing the critical thinking skills and scientific literacy students can draw on through college and beyond. Phelan's dynamic approach to teaching biology is the driving

public education, educators across the United States are all the more invested in preparing their students for state and national assessments. In *Tests That Teach: Using Standardized Tests to Improve Instruction*, Karen Tankersley guides you with proven tips and instructional strategies to help your students perform to their potential. Covering all core contents areas—language arts, social studies, math, and science—and respecting all levels of student performance, Tankersley

- *Examines the various types of questions that routinely appear on these assessments;
- *Provides sample multiple-choice and constructed-response questions from the tests;
- *Offers guidelines on how to create daily lessons that encourage students to practice the skills and demonstrate the knowledge they'll need to use on the high-stakes tests;

*Suggests word lists, games, discussion topics, and testing ideas for your classroom; and *Describes how school staff can create a learning community that fosters collaboration among teachers and high performance in students. Also included are a wealth of online resources for lesson plans, daily classroom activities, and virtual field trips, as well as links to every state's released materials on its own assessment. As Tankersley explains, teaching students the skills they need to do well on constructed-response tests will better prepare students both to score well on state and national assessments and to take their place as thoughtful and organized thinkers in a rapidly changing, competitive society.

KAPLAN'S MCAT REPUTATION: Kaplan gets more people into medical school than all other courses, combined. UTILITY: Can be used alone or with other companion books in Kaplan's MCAT Review series.

The Education Council Act of 1991 established the National Education Commission on Time and Learning as an independent advisory body and called for a comprehensive review of the relationship between time and learning in U.S.

schools. This document serves as a supplementary volume to the commission's first report released in May 1994, which found that most school-reform designs are structurally flawed by their adherence to a traditional school calendar. This volume describes innovative approaches to the use of school time. It provides nearly 40 examples of exemplary efforts to make better use of available time and extend the amount of time students spend learning. The brief program descriptions are from 15 elementary schools, 15 middle and senior high schools, 4 districtwide efforts, and 6 special programs. They include public and private schools in rural, urban, and suburban areas from 26 states. Information for reaching contact persons is provided. A review of the programs indicates that many different kinds of schools and districts

have already implemented many of the commission's recommendations. The most common approaches in descending order include: (1) redesigning available time; (2) employing technology; (3) extending the school day or year; (4) providing time for professional development; and (5) providing support services for children or families. Finally, the approaches to the redesign of time usage differ by school level. (LMI)

has a rapidly expanding organic agriculture and food sector, and there is a revolution in ecological food and ethical eating in China's cities. This book shows how a set of social, economic, cultural, and environmental conditions have converged to shape the development of a "formal" organic sector, created by "top-down" state-developed standards and regulations, and an "informal" organic sector, created by 'bottom-up' grassroots struggles for safe, healthy, and sustainable food. This is generating a new civil movement focused on ecological agriculture and quality food. Organic movements and markets have typically emerged in industrialized food systems that are characterized by private land ownership, declining small farm sectors, consolidated farm to retail chains, predominance of supermarket retail,

standards and laws to safeguard food safety, and an active civil society sector. The authors contrast this with the Chinese context, with its unique version of "capitalism with social characteristics," collective farmland ownership, and predominance of smallholder agriculture and emerging diverse marketing channels. China's experience also reflects a commitment to domestic food security, evolving food safety legislation, and a civil society with limited autonomy from a semi-authoritarian state that keeps shifting the terrain of what is permitted. The book will be of great interest to advanced students and researchers of agricultural and food systems and policy, as well as rural sociology and Chinese studies.

enzymes" in which proteins and DNA were distributed relatively haphazardly compared with animal and plant cells. Research performed over the past decade has revolutionized our understanding of bacterial cells, however, revealing that they are in fact highly organized and contain numerous subcompartments. Written and edited by experts in the field, this volume includes contributions discussing the three dimensional organization of the bacterial cell, various subcellular structures found in bacteria, membrane bounded organelles such as magnetosomes, and the organization of the cell membrane. Other chapters examine the recently identified bacterial cytoskeletal filaments which turn out to be remarkably similar to their eukaryotic counterparts as well as the roles of these filaments in morphogenesis and

cytokinesis. Also covered are the extraordinary organization of the bacterial genome and the dynamic mechanisms that couple its replication and partitioning at cell division. In addition, the book reviews the various different multicellular structures bacteria can form, such as biofilms, along with new imaging techniques that promise to reveal even more about their subcellular machinery. It is thus of interest to microscopists and biochemists, as well as all microbiologists and cell biologists interested in how bacteria and other prokaryotes function.
