The Bullet Game Engine Guide Physics are important not only in the world but also in games. Games are different universes where developers either desire to emulate more realistic systems of game physics, like in Grand Theft Auto V. Or maybe they want to throw it all out the window and create a wild and crazy lack of realistic physics.

A value of zero implies a variable tick rate, meaning Bullet advances the simulation exactly `timeStep` seconds instead of interpolating. This feature is buggy and not recommended. A value greater than one must always satisfy the equation `timeStep < maxSubSteps * fixedTimeStep` or you're losing time in the simulation.

I use Bullet for physics simulation and don't care about real-time simulation - it's ok if one minute of model time lasts two hours in real time. I am trying to call a callback every fixed amount of time in model time, but realized that I don't understand how `StepSimulation` works. The documentation of `StepSimulation()` isn't that clear. I would ...

Big physics sim with planets and whatnot. Many gravity wells and many objects inside those gravity wells. Physx thus far has proven to be jittery and unreal itself isn't able to handle more than an int32 in default blueprint. Bullet supposedly fixes these things and also already has accurate physics of many types, especially for a sim like this.
