Interpretation of Three-Dimensional Seismic Data is the definitive, and now classic, text on the subject. Conceived in 1979 and first published in 1986, the book helps geoscientists extract more information from their seismic data and improve the quality of their interpretations (James D. Robertson). The prime focus of the book continues to be the synergy between 3-D seismic data and the workstation.

Collection of closely spaced seismic data over an area permits three-dimensional processing of the data as a volume. The volume concept is equally important to the seismic interpreter. With 3-D data, the interpreter is working directly with a volume rather than interpolating a volumetric interpretation from a widely-spaced grid of observations.

In 1977 and 1978, a seismic survey was shot over the Dunlin field and processed using the technique of three-dimensional (3D) migration. Earlier seismic control together with appraisal drilling had proved that development of the field would be commercially viable, but the reservoir configuration was poorly defined. The 3D survey achieved its objectives of increasing confidence in the structural interpretation and providing a firmer basis for field development planning. planning.

[Three Dimensional Seismic Applications in Interpretation](#)

The interpretation process can be subdivided into three interrelated categories: structural, stratigraphic, and lithologic. Structural seismic interpretation is directed toward the creation of structural maps of the subsurface from the observed three-dimensional configuration of arrival times.

The aim was to perform reflection seismic processing for two-dimensional seismic lines, surveyed originally for refraction seismic interpretation. Advantage of this work is to get three-dimensional reflection seismic results from the existing data at only processing costs.

Several volume seismic attributes were used to interpret the field: reflection strength, cosine of instantaneous phase, variance and chaos, which made seismic interpretation much easier. Moreover, the ant tracking attribute workflow has been elaborated which greatly facilitated the monitoring and interpretation of the fault systems.
